

NAME

IPC::Msg - SysV Msg IPC object class

SYNOPSIS

```
use IPC::SysV qw(IPC_PRIVATE S_IRUSR S_IWUSR);
use IPC::Msg;
$msg = new IPC::Msg(IPC_PRIVATE, S_IRUSR | S_IWUSR);
$msg->snd(pack("l! a*",$msgtype,$msg));
$msg->rcv($buf,256);
$ds = $msg->stat;
$msg->remove;
```

DESCRIPTION

A class providing an object based interface to SysV IPC message queues.

METHODS

new (KEY , FLAGS)

Creates a new message queue associated with KEY. A new queue is created if

- KEY is equal to IPC_PRIVATE
- KEY does not already have a message queue associated with it, and *FLAGS* & IPC_CREAT is true.

On creation of a new message queue FLAGS is used to set the permissions. Be careful not to set any flags that the Sys V IPC implementation does not allow: in some systems setting execute bits makes the operations fail.

id

Returns the system message queue identifier.

rcv (BUF, LEN [, TYPE [, FLAGS]])

Read a message from the queue. Returns the type of the message read. See *msgrcv*. The BUF becomes tainted.

remove

Remove and destroy the message queue from the system.

```
set (STAT)
```

set (NAME => VALUE [, NAME => VALUE ...])

set will set the following values of the stat structure associated with the message queue.

```
uid
gid
mode (oly the permission bits)
qbytes
```

 $\tt set$ accepts either a stat object, as returned by the $\tt stat$ method, or a list of name-value pairs.

snd (TYPE, MSG [, FLAGS])

Place a message on the queue with the data from MSG and with type TYPE. See msgsnd.

stat

Returns an object of type IPC::Msg::stat which is a sub-class of Class::Struct. It provides the following fields. For a description of these fields see you system documentation.

uid gid cuid cgid mode qnum qbytes lspid lrpid stime rtime ctime
